

Arizona Instrument officially introduces Kris Vancers! Sample Preparation Tips

Over the last few months working within your industry I have seen a common denominator in all moisture testing no matter what type of material or method is being used: sample preparation. Sample prep can have a drastic effect on your final result. Whether you grind, dry, agitate, cool, or soak your material, if you do not have a consistent method to prep your sample, your results will not have the consistency you need to maintain the quality you and your customers expect in your finished product.

[Take me to your Blog!](#)

Did you know we have a full service lab at your disposal?

You can send us up to three samples per month and we will perform the method development, which includes sample preparation, for your instrument and material.....all at no cost! If you are a "customer-in-waiting" and would like to see what our instrument is capable of, you too can send us a sample to test at no cost.

Call me today with any questions!
